SALE PROCEDURE

Animals will be sold in uniform lots sorted according to breed types and size. Animals will become the property of the purchaser immediately after the sale. No cattle will be loaded until the conclusion of the sale. All fees will be collected after the sale. **No further sales or trades can be made on site after the sale closes.**

GUARANTEE

All heifers are guaranteed open.

TRANSPORTATION

If you purchase 10 head or more you will be provided free transportation within a 100 mile radius of London, KY. The Laurel County Cattlemen's Association reserves the right to transport the heifers by the most economical means possible. The Laurel County Cattlemen's Association assumes no liability in transportation. All cattle must be off premises the day of the sale.

C.A.I.P COST-SHARE FOR HEIFERS AND BULLS

Heifers and bulls purchased at the Laurel County Cattlemen's Association Heifer Sale are eligible for cost share under the Kentucky County Agriculture Investment Program. Cow/calf pairs and bred heifers/cows are not CAIP eligible.

CONTRIBUTORS

The sale committee and consignors wish to thank all those who have contributed to the success of this program. Your faith in our ability to make this program work is appreciated.

- Laurel County Cattlemen's Association
- Laurel County Extension Office Staff
- Animal House Vet Clinic
- Bundy Veterinary Services
- Noah's Ark Vet Clinic
- Bobby Wells, Auctioneer

HEALTH REQUIREMENTS

for all animals in the 2024 Spring Heifer Sale

All animals are tested PI negative

- Heifers are weighed and pelvic measured to MARC standards. All open heifers are checked and guaranteed open.
- Heifer reproductive tract score of 4 or 5 and pelvic measurements must be at least 160 sq. cm.
- Heifers are vaccinated for protection against IBR, PI3, BVD, BRSV, Vibriosis, Leptospirosis and boosted.
- Heifers are dewormed and treated for external parasites.
- All heifers exceed minimum weight requirement of 700 lbs.
- All animals are tested PI negative
- All bred heifers/cows have been pregnancy-checked 30 days prior to the sale and are guaranteed safe with calf. The seller guarantees the bred heifer to be safe with the calf for 30 days following the sale. Within the 30 days following the sale, the buyer is responsible for having a licensed veterinarian check the heifer in the event of a problem or slipped calf.

Managing BVD starts with the herd

Management of animal health is a major factor in maintaining quality beef herds in producing quality beef. Bovine viral diarrhea (BVD) may pose a bigger threat to herd health than previously thought. Often considered a feedlot problem, the highly infectious disease affects all beef production segments. In fact, BVD has ranch roots.

The name itself is misleading, for BVD-infected animals may never exhibit diarrhea. The virus suppresses the animal's immune system, increasing susceptibility to other infections. In the cow herd, BVD can cause infertility or abortion. Calves infected during gestation but surviving to term may be stunted or display physical defects. Some studies suggest BVD may be connected to "weak calf syndrome." Fetal infection in the first half of pregnancy may result in the birth of a calf that is persistently infected (PI) with BVD.

A PI calf is infected throughout its life, harboring large numbers of viral organisms in its body. Animals exposed to BVD after birth may become infected and be contagious for a few days, but a PI animal sheds the virus every day, for as long as it lives. For some, that isn't very long. An estimated 20 to 50 percent of PI calves die before reaching weaning age. Some PI calves never exhibit serious symptoms and go right on to harvest or as replacement heifers- but not many.

PI calves are constantly shedding the BVD virus from every route, through manure, urine, saliva and nasal secretions and they can spread the virus to other animals. If those animals develop acute infections, they shed the virus and increase exposure to more animals. Through the domino effect, one PI animal can have a major impact.

Because BVD suppresses immune function of infected animals, the door is opened to a host of other bacterial and viral infections. An animal infected with BVD is more susceptible to enteric and respiratory diseases. Experts still speculate to what extent feedlot disease losses may be attributed to BVD. Most agree that the cost is higher than previously imagined. Still, the greatest economic damage occurs at the cow-calf level due to reproductive losses among breeding females. Calves under six months of age also are at risk when BVD compromises their immune response.

Attention to cow herd bio-security appears to be the surest method of reducing losses to the calf producer and the feeder. Veterinarians advocate ranch health programs including vaccination of calves two to four weeks prior to weaning and again at weaning. However, discussion of BVD vaccination programs for breeding herds can be controversial.

Producers should use reasonable caution when buying replacement animals to avoid introduction of PI animals. Most PI animals die before becoming replacements, but not all. Knowing the biosecurity practices applied to the herd of origin should be a priority. Before introducing new animals to a breeding herd, an isolation period of at least 2 weeks is recommended. During isolation, immunizations may be boosted and testing should be considered to reduce the hazard. Because PI animals are hard to identify, detection of PI animals can be accomplished through analysis of a small piece of skin "notched" from the animal's ear or from blood sampled at an appropriate time.

In order to minimize risk of BVD introduction to your herd, the Laurel County Heifer Sale adopted protocol to vaccinate for BVD at weaning, pre-breeding and boosters prior to this sale. All sale heifers have also tested negative for BVD, PI (persistently infected) with an ear notch sample.

Producers are advised to consult their veterinarian regarding routine vaccination, prevention of exposure and elimination of PI carriers. Management of the risk posed by BVD should be part of every producer's total herd health management program.
